

Mobile Phone is an Excellent Assistant But a Bad Master. Does a New Application Black & White Guard From CMI Technologies Help to Decrease a Number of Divorces?

Prague, February 2009 – Company CMI Technologies, spol. s r.o. (<http://www.cmit.cz>), has launched a new useful application for Nokia mobile phones, called Black & White Guard.

The mobile phone is an excellent assistant, but it can also change a quiet life of many people into hell. It only takes a small inobservance and intimate information from SMS or data about intimate phone calls can get into unauthorized hands and cause a nuisance. According to psychologists "SMS are the most common reason of conjugal infidelity disclosure." Also in politics, SMS have played their role. But in any case, it is not just conjugal infidelity or politics.

Mobile application Black & White Guard minimizes this risk. It is able to "clear" intimate SMS and information about intimate calls and never forget it!

How does the application Black & White Guard work? Its activity is based on White List, a list of phone numbers, which is able to identify all intimate SMS and calls. Black & White Guard deletes these messages and data about calls and saves them into a Safe, where the user can read them. Access into Safe is protected by password.

Only few people know that better phones are able to save information about realized calls or sent or received SMS into two independent lists. You can delete messages but an advanced user is able to find information about its sending in another list. Similar situation is with calls.

Application works also with Black list, which allows automatic deleting of SMS and refusing calls from unwanted numbers. From these reasons the name of the program is Black & White Guard.

It is also possible to set automatic locking of the keyboard.

Application is secure and user friendly, therefore is a good and useful assistant. Black & White Guard is so far available for Nokia phones with operational system Symbian 3rd Edition, which belong to the most common mobile phones.
